Orthognathic Surgery

Background

<table>
<thead>
<tr>
<th>Orthognathic surgery</th>
<th>A class of surgical procedures designed to realign the maxillofacial skeletal structures with each other and with the other craniofacial structures. This surgery usually involves the maxilla and/or mandible, but other bony components may be involved as well. Orthognathic surgery can be performed to correct malocclusion, which cannot be improved with routine orthodontic therapy and where the functional impairments are directly caused by the malocclusion. The surgical goal is to improve function through correcting the underlying skeletal deformity that contributes to chewing, breathing and swallowing dysfunction.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maxillary advancement</td>
<td>A type of orthognathic surgery that may be necessary to improve the facial contour and normalize dental occlusion when there is a relative deficiency of the midface region. This is done by surgically moving the maxilla with sophisticated bone mobilization techniques and fixing it securely into place.</td>
</tr>
<tr>
<td>Mandibular surgery</td>
<td>Can be performed in conjunction with or separate from maxillary surgery. The mandible can be advanced, set back, tilted or augmented with bone grafts. A combination of these procedures may be necessary. Following any significant surgical movement of the mandible, fixation may be accomplished with mini-plates and screws or with a combination of interosseous wires and intermaxillary fixation (IMF). Rigid fixation (screws and plates) has the advantage of needing limited or no IMF. However, if interosseous wiring is used, IMF is maintained for approximately 6 weeks.</td>
</tr>
<tr>
<td>Malocclusion</td>
<td>Imperfect contact with the mandibular and maxillary teeth.</td>
</tr>
<tr>
<td>• Class II malocclusion: Occurs when the mandibular teeth are distal or behind the normal relationship with the maxillary teeth. This can be due to a deficiency of the lower jaw or an excess of the upper jaw, and therefore, presents two types: (1) Division I is when the mandibular arch is behind the upper jaw with a consequential protrusion of the upper front teeth. (2) Division II exists when the mandibular teeth are behind the upper teeth, with a retrusion of the maxillary front teeth. Both of these malocclusions have a tendency toward a deep bite because of the uncontrolled migration of the lower front teeth upwards. Commonly referred to as an overbite.</td>
<td></td>
</tr>
<tr>
<td>• Class III malocclusion: Occurs when the lower dental arch is in front of (mesial to) the upper dental arch. People with this type of occlusion usually have a strong or protrusive chin, which can be due to either horizontal mandibular excess or horizontal maxillary deficiency. Commonly referred to as an under bite.</td>
<td></td>
</tr>
</tbody>
</table>
Occlusion
Bringing the opposing surfaces of the teeth of the two jaws (mandible and maxilla) into contact with each other.

Supraeruption
The occurrence of a tooth continuing to grow out of the gum if the opposing tooth in the opposite jaw is missing.

Genioplasty
Plastic surgery of the chin (See Limitations/Exclusions)

Related Medical Guidelines

**Cosmetic Surgery Procedures**

**Obstructive Sleep Apnea Diagnosis and Treatment**

**Guideline**

*Note: Expenses associated with the pre-and-post surgical orthodontic component of are considered dental in nature and not covered under the member’s Medical Benefit.*

I. Orthognathic surgery is medically necessary for correcting the following skeletal deformities of the maxilla or mandible when the deformities are directly attributable to significant dysfunction that precludes dental/orthodontic therapeutics or when intra-oral trauma to soft tissues occurs through mastication secondary to malocclusion:

A. **Anteroposterior discrepancies defined as either:**
   1. Maxillary/mandibular incisor relationship; any:
      a. Horizontal overjet of $\geq 5$ millimeter (mm)
      b. Zero to a negative value (norm 2mm)
   2. Maxillary/mandibular anteroposterior molar relationship discrepancy of $\geq 4$ mm (norm is 0–1 mm)

   *Numeric values above represent $\geq 2$ standard deviations (SDs) from published norms.*

B. **Vertical discrepancies; defined as any:**
   1. Vertical facial skeletal deformity of $\geq 2$ SDs from norms for accepted skeletal landmarks
   2. Open Bite; either:
      a. No vertical overlap of anterior teeth
      b. Unilateral or bilateral posterior open bite $> 2$ mm
   3. Deep overbite with impingement or irritation of buccal, palatal or lingual soft tissues of the opposing arch
   4. Supraeruption of a dentoalveolar segment secondary to lack of opposing occlusion that creates dysfunction not amenable to conventional prosthetics

C. **Transverse discrepancies; defined as either:**
   1. Transverse skeletal discrepancy $\geq 2$ SDs from norms
   2. Total bilateral maxillary palatal cusp to mandibular fossa discrepancy of $\geq 4$ mm, or unilateral discrepancy $\geq 3$ mm (given normal axial inclination of the posterior teeth)

D. **Asymmetries; defined as anteroposterior, transverse or lateral asymmetries $> 3$ mm with concomitant occlusal asymmetry**
II. **Facial Skeletal Discrepancies Associated with Documented Sleep Apnea, Airway Defects, and Soft Tissue Discrepancies**

Orthognathic surgery is considered medically necessary for members with underlying congenital and acquired (i.e., post-traumatic or post-ablative) craniofacial skeletal deformities that are contributing to obstructive sleep apnea (see Obstructive Sleep Apnea) or other demonstrated significant functional deficiency.

III. **Speech Impairments**

Orthognathic surgery is medically necessary for the treatment of speech abnormalities (as determined by a speech pathologist or therapist) when the impairment is secondary to a malocclusion (e.g., from cleft deformity), which is refractory to either:

1. Orthodontia management
2. At least 6 months of speech therapy

**Documentation**

The following documentation must be submitted to the plan for medical necessity consideration:

1. Evidence of skeletal, facial or craniofacial deformity demonstrated by study models and pre-orthodontic photographic and radiographic imaging
2. Medical record detailing the following:
   a. Objective findings (i.e., functional impairment directly attributable to skeletal abnormality)
   b. Symptoms (e.g., dysphagia, choking), clinical course/treatment history

**Limitations/Exclusions**

1. Orthognathic surgery is considered cosmetic (and therefore not medically necessary) when anatomic variation is normal, and the member wishes to alter physical appearance in order to improve aesthetics. (Psychological motivation [e.g., self-esteem] is not a factor for plan-consideration).
2. Three-dimensional virtual treatment planning of orthognathic surgery regarded as investigational and not medically necessary, as effectiveness has not been established.
3. Orthognathic surgery is considered investigational for correcting articulation disorders (except in the presence of severe cleft palate; indicated above) and other impairments in the production of speech due to insufficient evidence of therapeutic value in the published peer-reviewed medical literature.
4. Orthognathic surgery is not considered medically necessary the correction of sibilant sound-class distortions or other speech quality distortions (e.g., hyper-nasal or hypo-nasal speech) because the distortions do not cause functional impairment.
5. Condylar positioning devices in orthognathic surgery are experimental and investigational because their effectiveness in orthognathic surgery has not been established.
6. Orthognathic surgery for temporomandibular joint disease (TMJ) or myofascial pain dysfunction is considered investigational due to insufficient evidence of therapeutic value for these indications.
7. Genioplasty is considered cosmetic and not medically necessary.

**Revision History**

<table>
<thead>
<tr>
<th>Date</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mar. 8, 2019</td>
<td>Added “palatal” to vertical discrepancies definition related to deep overbite</td>
</tr>
<tr>
<td></td>
<td>Added congenital, acquired, or other demonstrated significant functional deficiency, that contributes to obstructive sleep apnea (regarding craniofacial skeletal deformities)</td>
</tr>
<tr>
<td></td>
<td>Added photographic to documentation section</td>

</tbody>
</table>
Reconstruction of mandibular condyle with bone and cartilage autografts (includes obtaining grafts) (eg, for hemifacial microsomia)
Reconstruction of mandible or maxilla, endosteal implant (eg, blade, cylinder); partial
Reconstruction of mandible or maxilla, endosteal implant (eg, blade, cylinder); complete
Reconstruction of zygomatic arch and glenoid fossa with bone and cartilage (includes obtaining autografts)
Malar augmentation, prosthetic material
Secondary revision of orbitocraniofacial reconstruction
Reduction of masseter muscle and bone (eg, for treatment of benign masseteric hypertrophy); extraoral approach
Reduction of masseter muscle and bone (eg, for treatment of benign masseteric hypertrophy); intraoral approach
Unlisted craniofacial and maxillofacial procedure
Lengthening of palate, and pharyngeal flap
Lengthening of palate, with island flap
Repair of anterior palate, including vomer flap
Maxillary impression for palatal prosthesis
Insertion of pin-retained palatal prosthesis

Applicable ICD-10 Diagnosis Codes
G47.33  Obstructive sleep apnea (adult) (pediatric)
M26.00  Unspecified anomaly of jaw size
M26.01  Maxillary hyperplasia
M26.02  Maxillary hypoplasia
M26.03  Mandibular hyperplasia
M26.04  Mandibular hypoplasia
M26.05  Macrogenia
M26.06  Microgenia
M26.07  Excessive tuberosity of jaw
M26.09  Other specified anomalies of jaw size
M26.10  Unspecified anomaly of jaw-cranial base relationship
M26.11  Maxillary asymmetry
M26.12  Other jaw asymmetry
M26.19  Other specified anomalies of jaw-cranial base relationship
M26.20  Unspecified anomaly of dental arch relationship
M26.211 Malocclusion, Angle’s class I
M26.212 Malocclusion, Angle’s class II
M26.213 Malocclusion, Angle’s class III
M26.219 Malocclusion, Angle’s class, unspecified
M26.220 Open anterior occlusal relationship
M26.221 Open posterior occlusal relationship
M26.23  Excessive horizontal overlap
M26.24  Reverse articulation
M26.25  Anomalies of interarch distance
M26.29  Other anomalies of dental arch relationship
M26.30  Unspecified anomaly of tooth position of fully erupted tooth or teeth
M26.31  Crowding of fully erupted teeth
M26.32  Excessive spacing of fully erupted teeth
