Medical Guideline Disclaimer

The treating physician or primary care provider must submit to EmblemHealth the clinical evidence that the member meets the criteria for the treatment or surgical procedure. Without this documentation and information, EmblemHealth will not be able to properly review the request preauthorization or post-payment review. The clinical review criteria expressed below reflects how EmblemHealth determines whether certain services or supplies are medically necessary. This clinical policy is not intended to pre-empt the judgment of the reviewing medical director or dictate to health care providers how to practice medicine. Health care providers are expected to exercise their medical judgment in rendering appropriate care. Health care providers are expected to exercise their medical judgment in rendering appropriate care. EmblemHealth established the clinical review criteria based upon a review of currently available clinical information (including clinical outcome studies in the peer reviewed published medical literature, regulatory status of the technology, evidence-based guidelines of public health and health research agencies, evidence-based guidelines and positions of leading national health professional organizations, views of physicians practicing in relevant clinical areas, and other relevant factors). Each benefit program defines which services are covered. The conclusion that a particular service or supply is medically necessary does not constitute a representation or warranty that this service or supply is covered and/or paid for by EmblemHealth, as some programs exclude coverage for services or supplies that EmblemHealth considers medically necessary.

If there is a discrepancy between this guideline and a member's benefits program, the benefits program will govern. Definition

Negative-pressure wound therapy (NPWT), or vacuum-assisted wound closure (VAC), is the controlled application of negative pressure to a wound with an electrical pump that intermittently or continuously conveys negative pressure through connective tubing to a specialized wound dressing. A resilient, opencell, foam surface dressing, sealed with an occlusive dressing, contains the negative pressure at the wound site, thus promoting healing. The healing is associated with the removal of excess interstitial fluid, increased vascularity, decreased bacterial colonization and the stimulation of healthy tissue growth by drawing the edges of the wound toward the center. Lightweight versions may be used in the inpatient or outpatient settings.

Wound Documentation

For the initiation and continuation of NPWT, the following documentation, inclusive of original color photographs with date, time and member name must be provided to the Plan upon request:

- 1. Appearance color, odor, presence of granulation tissue, necrosis
- 2. Exudates color, amount, odor
- 3. Location
- 4. Size recorded measurement should be done each time the VAC is changed and should include a detailed wound description

Guideline

Members with the DME benefit are eligible for NPWT when the following criteria per wound type are met (see <u>Table 1</u> for pressure ulcer staging):

Presence of a chronic stage III or IV pressure ulcer; a neuropathic (e.g., diabetic) ulcer; an ulcer with venous or arterial insufficiency etiology; or a chronic ulcer (presence ≥ 30 days) of mixed etiology

Note: The 30-day waiting period is waved for members with seronegative arthropathies and connective tissue disorder comorbidities in conjunction with acute wounds (as the presence of these disorders can inhibit the normal healing process)

1. A complete wound therapy program applicable to the type of wound has been ruled out, or attempted unsuccessfully, prior to NPWT initiation

For all wounds, a wound therapy program must include a minimum of all the following general measures:

- a. Determination of etiology and prior appropriate treatment of such
- b. Documentation of wound (see Wound Documentation p. 1)
- c. Application of dressings to ensure wound moisture
- d. Debridement of necrotic tissue, as appropriate
- e. Evaluation of, and provision for, adequate nutritional status
- f. Documentation of wound onset date

Therapy programs for the following wound types require these additional measures:

Stage III and IV pressure ulcers

- a. Appropriate turning and repositioning
- b. Prior use of a group 2 or 3 support surface for posterior trunk or pelvis pressure ulcers (not a prerequisite for alternate wound sites)¹
- c. Appropriate treatment of moisture and incontinence

Neuropathic ulcers ²

- a. Comprehensive diabetes management program
- b. Foot-ulcer pressure reduction with contact casting or other method of pressure relief (e.g., Bledsoe boot), unless contraindicated, with the foot well vascularized.

Venous insufficiency ulcers

- a. Compression bandages or garments (e.g., Unna boot), unless contraindicated, have been applied
- b. Leg elevation and ambulation have been documented

¹ Types of pressure-reducing support surfaces per Medicare's Durable Medical Equipment Regional Carrier policies (listing of item does not necessarily indicate coverage):

Group 2 — Powered air flotation bed (low-air-loss therapy); powered, pressure-reducing air mattress; non-powered, advanced, pressure-reducing overlay for mattress, standard mattress length and width; powered air overlay for mattress, standard mattress length and width; non-powered, advanced, pressure-reducing mattress.

Group 3 — Air-fluidized bed.

² Appropriate modalities must include a therapeutic device for off-loading. Lack of weight bearing alone does not meet this criterion.

c. Maximal therapy for edema and swelling for ≥ 30 days prior to initiation of VAC

Ulcers and wounds encountered in an inpatient setting

- a. VAC therapy initiated per the judgment of the treating physician as the best available treatment option
- Complication of a surgically created wound (i.e., dehiscence), or a traumatic wound where there is documentation substantiating the medical necessity for accelerated formation of granulation tissue that cannot be achieved by other available topical wound treatments
- 2. The ongoing wound care is performed by a licensed health care provider and there is at least monthly documentation of wound characteristics (see <u>Wound Documentation</u> p. 1)
- 3. The recorded wound measurement demonstrates progressive wound healing without intervening complications from month to month
- 4. Skin grafts
 - a. Comprehensive wound therapy
 - b. Adequate granulation bed

NPWT is considered medically necessary for members with peripheral arterial disease who have undergone revascularization

Limitations/Exclusions

- 1. Disposable non-powered mechanical (e.g., Smart Negative Pressure [SNaP®] Wound Care Device) NPWT/VAC (CPT codes 97607, 97608, HCPCS code A9272) is considered experimental, investigational or unproven for any indication. (Note: Medicare covers 97607, 97608 per the coding table below, however A9272 is not separately reimbursed)
- 2. Disposable single use battery-powered (e.g., PICO™ Single Use Negative Pressure Wound Therapy System, Prevena™ Incision Management System, V.A.C. Via™ Negative Pressure Wound Therapy System, MyNeWT Negative Pressure Wound Therapy System, Uno Negative Pressure Wound Therapy System) NPWT/VAC (CPT codes 97607, 97608, HCPCS code A9272) is considered experimental, investigational, or unproven for any indication. (Note: Medicare covers 97607, 97608 per the coding table below, however A9272 is not separately reimbursed)
- 3. NPWT is not considered medically necessary if the above criteria have not been met, or in the presence of any of the following:
 - a. Cancer in the wound
 - b. Necrotic tissue with eschar
 - c. Untreated osteomyelitis within the vicinity of the wound
 - d. Fistula to an organ or body cavity within the vicinity of the wound
- 4. NPWT continuation the majority of patients with stage III and IV ulcers achieve sufficient wound closure within 6 weeks of therapy. While coverage for > 4 months is generally not considered medically necessary, individual consideration will be given based upon required additional documentation. (See Wound Documentation p. 1)
- 5. NPWT discontinuation May be discontinued when the following are applicable:

- a. Physician performs serial débridements (3–4x) within 90 days
- b. Failure of any measurable degree of wound healing within prior month. (Grafts should heal in 7 days; no later than 1-month)
- c. There must be documentation of quantitative measurements of wound characteristics (see <u>Wound Documentation</u> p. 1) over a specified time interval. The recorded wound measurements must be consistently and regularly updated and must demonstrate progressive wound healing from month to month
- d. No further changes in depth of wound
- e. Member is non-compliant
- f. Presence of sloughing > 20%
- g. No full thickness present

Table 1 — Pressure Ulcer Staging

Stage I	Non-blanchable erythema of intact skin
Pressure Injury	Intact skin with a localized area of non-blanchable erythema, which may appear differently in darkly pigmented skin. Presence of blanchable erythema or changes in sensation, temperature, or firmness may precede visual changes. Color changes do not include purple or maroon discoloration; these may indicate deep tissue pressure injury.
Stage II	Partial-thickness skin loss with exposed dermis Partial-thickness loss of skin with exposed dermis.
Pressure Injury	The wound bed is viable, pink or red, moist, and may also present as an intact or ruptured serum-filled blister. Adipose (fat) is not visible and deeper tissues are not visible. Granulation tissue, slough and eschar are not present. These injuries commonly result from adverse microclimate and shear in the skin over the pelvis and shear in the heel. This stage should not be used to describe moisture associated skin damage (MASD) including incontinence associated dermatitis (IAD), intertriginous dermatitis (ITD), medical adhesive related skin injury (MARSI), or traumatic wounds (skin tears, burns, abrasions).
Stage III	Full-thickness skin loss
Pressure Injury	Full-thickness loss of skin, in which adipose (fat) is visible in the ulcer and granulation tissue and epibole (rolled wound edges) are often present. Slough and/or eschar may be visible. The depth of tissue damage varies by anatomical location; areas of significant adiposity can develop deep wounds. Undermining and tunneling may occur. Fascia, muscle, tendon, ligament, cartilage and/or bone are not exposed. If slough or eschar obscures the extent of tissue loss this is an Unstageable Pressure Injury.
Stage IV	Full-thickness skin and tissue loss
Pressure Injury	Full-thickness skin and tissue loss with exposed or directly palpable fascia, muscle, tendon, ligament, cartilage or bone in the ulcer. Slough and/or eschar may be visible. Epibole (rolled edges), undermining and/or tunneling often occur. Depth varies by anatomical location. If slough or eschar obscures the extent of tissue loss this is an Unstageable Pressure Injury.
Unstageable	Obscured full-thickness skin and tissue loss
Pressure Injury	Full-thickness skin and tissue loss in which the extent of tissue damage within the ulcer cannot be confirmed because it is obscured by slough or eschar. If slough or eschar is removed, a Stage 3 or

	Stage 4 pressure injury will be revealed. Stable eschar (i.e. dry, adherent, intact without erythema or fluctuance) on the heel or ischemic limb should not be softened or removed.
Deep Tissue Pressure Injury (DPTI)	Persistent non-blanchable deep red, maroon or purple discoloration Intact or non-intact skin with localized area of persistent non-blanchable deep red, maroon, purple discoloration or epidermal separation revealing a dark wound bed or blood filled blister. Pain and temperature change often precede skin color changes. Discoloration may appear differently in darkly pigmented skin. This injury results from intense and/or prolonged pressure and shear forces at the bone-muscle interface. The wound may evolve rapidly to reveal the actual extent of tissue injury, or may resolve without tissue loss. If necrotic tissue, subcutaneous tissue, granulation tissue, fascia, muscle or other underlying structures are visible, this indicates a full thickness pressure injury (Unstageable, Stage 3 or Stage 4). Do not use DTPI to describe vascular, traumatic, neuropathic, or dermatologic conditions.
