Capsule Endoscopy (Camera Pill)

Definition

Telemetric gastrointestinal capsule imaging (also referred to as the camera pill or wireless capsule endoscopy) is a noninvasive diagnostic imaging system for use in viewing the esophagus or gastrointestinal (GI) tract, especially the small bowel, which is not accessible to standard upper endoscopy and colonoscopy. A small capsule (approximately 11 × 26 mm) is swallowed and moves through the GI tract via peristalsis, capturing video pictures which are transmitted to sensors taped to the body and stored on a portable recorder. The strength of the signal is used to calculate the position of the capsule as it passes through the GI tract. Video images are stored on a portable recorder and later downloaded to a computer, from which they may subsequently be viewed in real time. The capsule passes naturally from the body with the stool and, being disposable, is not recovered.

Guideline

Members are eligible for esophageal or small bowel capsule endoscopy coverage (when performed by gastroenterologists or independent diagnostic testing facilities under the general supervision of a gastroenterologist) for any of the following indications:

1. **Esophageal varices** for members with cirrhosis and portal hypertension and no prior variceal bleeding

   Cirrhosis and portal hypertension are defined as a Child’s class B or C stage or a class A with a low platelet count (<140,000), an enlarged portal vein diameter (> 13 mm) or evidence of collateral circulation on ultrasound.

   An initial camera pill evaluation is considered reasonable and will enable the presence and/or size of varices to be determined. Follow-up studies are permissible as follows:
a. No varices — repeat at 3 years.

b. Small — repeat every 1–2 years (diameter > 0 and < ¼ of the video circumference for the frame that shows its largest diameter).

c. Medium to large — repeat not medically necessary; endoscopy is the appropriate modality for subsequent evaluation (≥ ¼ of the circumference).

2. Small Bowel

a. Occult GI bleeding — the medical record must document the presence of GI bleeding and contain reports of previous negative upper and lower endoscopies performed during the current episode of illness.

b. Iron deficiency anemia with confirmed blood loss only — the medical record must document the presence of anemia secondary to blood loss and reports of previous upper and lower endoscopies.

c. Celiac sprue — when celiac disease is present and member fails to improve post three-month trial of gluten-free diet and has abnormal weight loss and diarrhea.

d. Crohn’s disease — diagnosis known — but it is necessary to determine whether there is small bowel involvement.

e. Crohn’s disease — diagnosis suspected — when there is a strong clinical suspicion of the disease (prior radiological study to exclude stricture must have been performed, which did not demonstrate the presence of Crohn’s disease). All of the following must be present:
   i. Abdominal pain.
   ii. Occult or overt GI bleeding.
   iii. Diarrhea.
   iv. Weight loss.

   Note: For this indication, coverage may be provided without the member having undergone a prior upper GI endoscopy and colonoscopy.

   The medical record must document that a diagnosis of the disease requires confirmation; if the diagnosis is known, the documentation must reflect that it is necessary to determine small bowel involvement. For those members in whom there was a high clinical suspicion of Crohn’s disease and who had a capsule endoscopy performed without prior upper endoscopy or colonoscopy, the medical record should document a prior radiologic procedure that excluded strictures.

f. Colitis — for those cases in which a diagnosis of colitis of an indeterminate type affecting the colon is known and in whom a more specific diagnosis is sought by evaluating for possible small bowel involvement. The medical record must document that the test is necessary in order to evaluate small bowel involvement.

g. Angiectasias of the GI tract — for the diagnosis of angiectasias, as evidenced by recurrent episodes of obscure GI bleeding.

h. Small bowel neoplasm — for the diagnosis of small bowel neoplasm when the diagnosis has not been previously confirmed by other studies (e.g., upper gastrointestinal endoscopy, colonoscopy, push enteroscopy, nuclear imaging or radiological procedures).

   The member must have neoplasm symptoms; all of the following must be present:
   i. Abdominal pain.
   ii. Occult or overt GI bleeding.
iii. Diarrhea.
iv. Weight loss.

**OR**

v. Have documented polyposis syndrome associated with small bowel neoplasia.

**OR**

vi. Have other history suggesting the presence of small bowel neoplasia (i.e., intermittent obstruction or intussusception) and have undergone prior diagnostic testing (i.e., upper GI endoscopy and/or colonoscopy and radiological studies) to assess these symptoms.

*Note: The requirement for prior examination by upper and lower endoscopies may be waived for members with documented intussusception of the small bowel without established etiology.*

i. Inflammatory bowel disease. All of the following must be present:

   i. Abdominal pain.
   ii. Occult or overt GI bleeding.
   iii. Diarrhea.
   iv. Weight loss.

j. Other conditions — evaluation of malabsorptions syndrome or protein-losing enteropathy of an obscure origin, as evidenced by the following:

   i. Diarrhea with greasy voluminous foul smelling stool, and
   ii. Weight loss despite adequate food intake.

   **OR**

   iii. Anorexia, and
   iv. Flatulence, and
   v. Abdominal distention.

Appropriate prior negative or non-diagnostic evaluations of the esophagus, stomach, duodenum/small intestine, and colon by flexible endoscopy, and complementary radiologic procedures and/or microbiologic studies must be documented.

k. Evaluation prior to surgery — evaluation of extent of small bowel involvement with arteriovenous malformations or lymphangiectasia for members who are contemplated for surgical resection of the small bowel to control recurrent bleeding or protein loss is reasonable.

**Limitations/Exclusions**

1. Gastrointestinal tract must be patent

2. Patency systems to verify GI tract patency prior to camera pill ingestion (e.g., Given® AGILE as an accessory to the PillCam™) are not considered medically necessary, as there is insufficient evidence to support its use.

3. The SmartPill™ motility testing system (CPT 91112), which measures pressure, pH, transit time and temperature is not considered medically necessary, as there is insufficient evidence to support its use.
4. The camera pill colon (e.g., PillCam Colon®) is not considered medically necessary, as there is insufficient evidence of therapeutic value.

5. The camera pill is not considered medically necessary for any of the following:
   a. Bright red blood per rectum.
   b. Colorectal cancer screening.
   c. Hematemesis.
   d. Crohn’s disease, when used for management rather than diagnosis. (Coverage is provided when utilized to determine extent of small bowel disease).
   e. Detection of small bowel malignancies in the absence of obscure GI bleeding or symptoms suggesting Crohn’s disease.
   f. For the evaluation of gastroesophageal reflux.
   g. For the follow-up evaluation of medium to large esophageal varices.
   h. Confirmation of lesions or pathologies that are:
      i. Normally within the reach of upper or lower endoscopes (lesions proximal to the second portion of the duodenum or distal to the ileum).
      OR
      ii. Previously discovered by any of the following diagnostic modalities:
         1. Prior endoscopy (including push enteroscopy).
         2. Colonoscopy.

### Glossary

- **K52.0**: Gastroenteritis and colitis due to radiation
- **K55.1**: Chronic vascular disorders of intestine
- **K55.21**: Angiodysplasia of colon with hemorrhage
- **K57.11**: Diverticulosis of small intestine without perforation or abscess with bleeding
- **K57.13**: Diverticulitis of small intestine without perforation or abscess with bleeding
- **K57.51**: Diverticulosis of both small and large intestine without perforation or abscess with bleeding
- **K57.53**: Diverticulitis of both small and large intestine without perforation or abscess with bleeding
- **K63.81**: Dieulafoy lesion of intestine
- **K76.6**: Portal hypertension
- **K90.0**: Celiac disease
- **K92.0**: Hematemesis
- **K92.1**: Melena
- **K92.2**: Gastrointestinal hemorrhage, unspecified
- **R10.10**: Upper abdominal pain, unspecified
- **R10.11**: Right upper quadrant pain
- **R10.12**: Left upper quadrant pain
- **R10.13**: Epigastric pain
- **R19.5**: Other fecal abnormalities
- **R19.7**: Diarrhea, unspecified
- **R63.0**: Anorexia
- **R63.4**: Abnormal weight loss
- **R93.3**: Abnormal findings on diagnostic imaging of other parts of digestive tract
